Re: Leadership in Energy and Environmental Design (LEED)

Mueller Industries has two tube manufacturing facilities in the United States that manufacture water tubing, refrigeration tubing, and medical gas tubing. Both facilities use a large amount of recycled copper scrap in their melting and casting processes.

The Wynne Arkansas facility produces 60% of our total water tube production. This facility uses 80% scrap and recycled copper in its melt mix. The remaining 40% of the water tube produced is made in our Fulton Mississippi manufacturing plant. This plant utilizes 50% recycled and scrap copper in its melting process. We utilize approximately 50 percent post-industrial and 50 percent post-consumer material.

If you require any additional information on the amount of recycled materials Mueller utilizes please feel free to call me.

Sincerely,

John H. Webb
